

Episode construction and follow-up availability

Counts refer to episodes, not unique people.

Stage or subset	UKHLS	HRS
Sample construction		
Collapsed candidate episodes	62,605	61,970
Episodes containing a primary adversity	44,949	19,677
Isolated primary-adversity episodes	43,249	18,976
Valid self-report before and at the event	38,442	16,938
Final trajectory sample	38,438	16,938
Follow-up availability		
Additional earlier pre-event assessment available	30,384	13,370
Observed, uncensored two-year follow-up	22,845	12,125
Observed, uncensored four-year follow-up	12,957	9,140
Complete pre-event, event, two- and four-year observations	11,870	7,973
Concurrent events		
Isolated primary-adversity episodes	43,249	18,976
Multiple primary adversities at the same transition	1,700	701
Primary adversity with a concurrent secondary event	3,077	5,846
Follow-up censoring		
Two-year follow-up censored by a later primary adversity	8,713	3,677
Four-year follow-up censored by a later primary adversity	13,265	5,877

Availability, concurrent-event and censoring rows are overlapping subsets, not sequential exclusions. Compound episodes are retained once for sensitivity analyses. A later primary adversity censors follow-up at or after its transition.
